

How to install a license on jetNEXUS Enterprise Traffic Manager

Synopsis

This document explains how to install a new license on a jetNEXUS Enterprise Traffic Manager.

Stages:

1: How to get a license

2: How to install the license

Stage 1: How to get a license

To get a license you will need to email the MAC addresses of the appliance(s) that require licenses. To get the MAC addresses open a SSH session on to the appliance and log in. Then run:

```
ifconfig -a | grep -i hwaddr
```

Highlight the output and copy it into an email to support@jetnexus.com. Also in that email please provide the serial number from the rear of the appliance.

Stage 2: How to install the license

On receipt of the license file, usually over email, save it somewhere you will find it in a while. Then open a web browser on to the web GUI for the appliance. Go to the "System > Licenses" page and scroll to the bottom. In the section labeled "Install new License Key" click the browse button. Locate the license file saved earlier and click open. Then back in the web page click install Key. This will install the key and update the appliance. If you had a temporary key and do not need to use it any more, tick the box next to it and click the "Remove Selected Keys" button. This will remove the temporary key, leaving just the permanent installed license.
