

## jetNEXUS ETM: To Add 'X-Forwarded-For' Header to traffic

---

Open the web console to the Traffic Manager and go to "Catalogs > Rules".

Scroll to the Create new rule section. Type in a name for the new rule, something like "Add X-Forwarded-For". Make sure that RuleBuilder is selected and click Create Rule.

On the right hand side, click Actions to reveal that set of rules. Click "Set header", this will add this to the new rule. On the left hand side in the Set Header boxes type: "X-Forwarded-For" in the first and "%REMOTE\_IP%" in the second.

Then click update to save this rule.

Go to the "Services > Virtual Servers" page and open a virtual server that will need to insert this header. Then click on rules. In the request rules select the rule you just created and click "add rule". Make sure it is enabled. This will be active and you should be able to test this now.
